

Lab 4: Asymmetric (Public) Key

Objective: The key objective of this lab is to provide a practical introduction to public key encryption, and with a focus on RSA and Elliptic Curve methods. This includes the creation of key pairs and in the signing process.

 **Web link (Weekly activities):** <https://asecuritysite.com/eseconomy/unit04>

A RSA Encryption

A.1 The following defines a public key that is used with PGP email encryption:

```
-----BEGIN PGP PUBLIC KEY BLOCK-----
Version: GnuPG v2

-----END PGP PUBLIC KEY BLOCK-----
```

Using the following Web page, determine the owner of the key, and the ID on the key:

<https://asecuritysite.com/encryption/pgp1>

By searching on-line, can you find the public key of three famous people, and view their key details, and can you discover some of the details of their keys (eg User ID, key encryption method, key size, etc)?

By searching on-line, what is an ASCII Armored Message?

A.2 Bob has a private RSA key of:

```
MIICXAIBAAKBGQCWgjkEoyCxm9v6VBnUi5ihQ2knkdxGDL3GXLIUU43/froeqk7q9mtxT4AnPAaDX3f2r4STZYYiqXGSH

keyDER = b64decode(privatekey)
keys = RSA.importKey(keyDER)

dmsg = keys.decrypt(b64decode(msg))
print dmsg
```

What is the plaintext message that Bob has been sent?

B OpenSSL (RSA)

We will use OpenSSL to perform the following:

No	Description	Result
B.1	First we need to generate a key pair with: openssl genrsa -out private.pem 1024 This file contains both the public and the private key.	What is the type of public key method used: How long is the default key: How long did it take to generate a 1,024 bit key?

		Use the following command to view the keys: <code>cat private.pem</code>
B.2	Use following command to view the output file: <code>cat private.pem</code>	What can be observed at the start and end of the file:
B.3	Next we view the RSA key pair: <code>openssl rsa -in private.pem -text</code>	Which are the attributes of the key shown: Which number format is used to display the information on the attributes:
B.4	Let's now secure the encrypted key with 3-DES: <code>openssl rsa -in private.pem -des3 -out key3des.pem</code>	
B.5	Next we will export the public key: <code>openssl rsa -in private.pem -out public.pem -outform PEM -pubout</code>	View the output key. What does the header and footer of the file identify?
B.6	Now we will encrypt with our public key: <code>openssl rsautl -encrypt -inkey public.pem -pubin -in myfile.txt -out file.bin</code>	
B.7	And then decrypt with our private key: <code>openssl rsautl -decrypt -inkey private.pem -in file.bin -out decrypted.txt</code>	What are the contents of decrypted.txt

On your VM, go into the ~/.ssh folder. Now generate your SSH keys:

```
ssh-keygen -t rsa -C "your email address"
```

The public key should look like this:

```
ssh-rsa
AAAAB3NzaC1yc2EAAAADAQABAAQDLrriUNYTyWuClIW7H6yea3hMV+rm029m2f6Iddt1ImHroXjNwYyt4E1kkc7Azo
y899C3gpx0kJK45k/CLbPnrHvkLvtQ0AbzWEQpOKXI+tw06PcqJNmTB8ITRLqIFQ++ZanjHWMw2Odew/514y1dQ8dcccO
uzeGhL2Lq9dtfhSxx+1cBLcyoSh/lQcs1HpXtpwU8JmXWJl409RQOVn3gousp/P/0R8mz/RwkmsFsyDRLgQK+xtQxbpbo
dpnz5lIOPwn5LnT0si7eHmL3WikTyg+QLZ3D3m44NCeNb+b0JbfaQ2ZB+lv8C30xy1xSp2sxxPZMbrZWqGSLPjgdIFIBL
w.buchanan@napier.ac.uk
```

View the private key. Outline its format?

On your Ubuntu instance setup your new keys for ssh:

```
ssh-add ~/.ssh/id_git
```

Now create a Github account and upload your public key to Github (select Settings-> **New SSH key** or **Add SSH key**). Create a new repository on your GitHub site, and add a new file to it. Next go to your Ubuntu instance and see if you can clone of a new directory:

```
git clone ssh://git@github.com/<user>/<repository name>.git
```

C OpenSSL (ECC)

Elliptic Curve Cryptography (ECC) is now used extensively within public key encryption, including with Bitcoin, Ethereum, Tor, and many IoT applications. In this part of the lab we will use OpenSSL to create a key pair. For this we generate a random 256-bit private key (*priv*), and then generate a public key point (*priv* multiplied by *G*), using a generator (*G*), and which is a generator point on the selected elliptic curve.

No	Description	Result
C.1	<p>First we need to generate a private key with:</p> <pre>openssl ecparam -name secp256k1 -genkey -out priv.pem</pre> <p>The file will only contain the private key (and should have 256 bits).</p> <p>Now use “cat priv.pem” to view your key.</p>	<p>Can you view your key?</p>
C.2	<p>We can view the details of the ECC parameters used with:</p> <pre>openssl ecparam -in priv.pem -text -param_enc explicit -noout</pre>	<p>Outline these values:</p> <p>Prime (last two bytes):</p> <p>A:</p> <p>B:</p> <p>Generator (last two bytes):</p> <p>Order (last two bytes):</p>

C.3	<p>Now generate your public key based on your private key with:</p> <pre>openssl ec -in priv.pem -text -noout</pre>	<p>How many bits and bytes does your private key have:</p> <p>How many bit and bytes does your public key have (Note the 04 is not part of the elliptic curve point):</p> <p>What is the ECC method that you have used?</p>
------------	---	---

If you want to see an example of ECC, try here: <https://asecuritysite.com/encryption/ecc>

D Elliptic Curve Encryption

D.1 In the following Bob and Alice create elliptic curve key pairs. Bob can encrypt a message for Alice with her public key, and she can decrypt with her private key. Copy and paste the program from here:

<https://asecuritysite.com/encryption/elc>

Code used:

```
import OpenSSL
import pyelliptic

secretkey="password"
test="Test123"

alice = pyelliptic.ECC()
bob = pyelliptic.ECC()

print "++++Keys++++"
print "Bob's private key: "+bob.get_privkey().encode('hex')
print "Bob's public key: "+bob.get_pubkey().encode('hex')

print
print "Alice's private key: "+alice.get_privkey().encode('hex')
print "Alice's public key: "+alice.get_pubkey().encode('hex')

ciphertext = alice.encrypt(test, bob.get_pubkey())
print "\n++++Encryption++++"
print "Cipher: "+ciphertext.encode('hex')
print "Decrypt: "+bob.decrypt(ciphertext)
signature = bob.sign("Alice")
print
print "Bob verified: "+ str(pyelliptic.ECC(pubkey=bob.get_pubkey()).verify(
signature, "Alice"))
```

For a message of “Hello. Alice”, what is the ciphertext sent (just include the first four characters):

How is the signature used in this example?

D.2 Let's say we create an elliptic curve with $y^2 = x^3 + 7$, and with a prime number of 89, generate the first five (x,y) points for the finite field elliptic curve. You can use the Python code at the following to generate them:

https://asecuritysite.com/encryption/ecc_points

First five points:

D.3 Elliptic curve methods are often used to sign messages, and where Bob will sign a message with his private key, and where Alice can prove that he has signed it by using his public key. With ECC, we can use ECDSA, and which was used in the first version of Bitcoin. Enter the following code:

```
from ecdsa import SigningKey, NIST192p, NIST224p, NIST256p, NIST384p, NIST521p, SECP256k1
import base64
import sys

msg="Hello"
type = 1
cur=NIST192p

sk = SigningKey.generate(curve=cur)
vk = sk.get_verifying_key()

signature = sk.sign(msg)

print "Message:\t",msg
print "Type:\t\t",cur.name
print "======"

print "Signature:\t",base64.b64encode(signature)
print "======"

print "Signatures match:\t",vk.verify(signature, msg)
```

What are the signatures (you only need to note the first four characters) for a message of “Bob”, for the curves of NIST192p, NIST512p and SECP256k1:

NIST192p:

NIST512p:

SECP256k1:

By searching on the Internet, can you find in which application areas that SECP256k1 is used?

What do you observe from the different hash signatures from the elliptic curve methods?

E RSA

E.1 We will follow a basic RSA process. If you are struggling here, have a look at the following page:

<https://asecuritysite.com/encryption/rsa>

First, pick two prime numbers:

p=
q=

Now calculate N (p.q) and PHI [(p-1).(q-1)]:

N=
PHI =

Now pick a value of e which does not share a factor with PHI [$\text{gcd}(\text{PHI}, e) = 1$]:

e =

Now select a value of d , so that $(e.d) \pmod{\text{PHI}} = 1$:

[Note: You can use this page to find d : <https://asecuritysite.com/encryption/inversemod>]

d =

Now for a message of $M=5$, calculate the cipher as:

$C = M^e \pmod{N} =$

Now decrypt your ciphertext with:

$M = C^d \pmod{N} =$

Did you get the value of your message back ($M=5$)? If not, you have made a mistake, so go back and check.

Now run the following code and prove that the decrypted cipher is the same as the message:

```
p=11
q=3
N=p*q
PHI=(p-1)*(q-1)
e=3
for d in range(1,100):
    if ((e*d % PHI)==1): break
print e,N
print d,N
```

```

M=4
cipher = M**e % N
print cipher
message = cipher**d % N
print message

```

Select three more examples with different values of p and q, and then select e in order to make sure that the cipher will work:

E.2 In the RSA method, we have a value of e, and then determine d from $(d \cdot e) \pmod{\phi(N)} = 1$. But how do we use code to determine d? Well we can use the Euclidean algorithm. The code for this is given at:

<https://asecuritysite.com/encryption/inversemod>

Using the code, can you determine the following:

Inverse of 53 (mod 120) =

Inverse of 65537 (mod 1034776851837418226012406113933120080) =

Using this code, can you now create an RSA program where the user enters the values of p, q, and e, and the program determines (e,N) and (d,N)?

F PGP

F.1 The following is a PGP key pair. Using <https://asecuritysite.com/encryption/pgp>, can you determine the owner of the keys:

```

-----END PGP PRIVATE KEY BLOCK-----

```

F.2 Using the code at the following link, generate your own key:

<https://asecuritysite.com/encryption/openpgp>

F.3 An important element in data loss prevention is encrypted emails. In this part of the lab we will use an open source standard: PGP.

No	Description	Result
1	<p>Create a key pair with (RSA and 2,048 bit keys):</p> <p>gpg --gen-key</p> <p>Now export your public key using the form of:</p> <p>gpg --export -a "Your name" > mypub.key</p> <p>Now export your private key using the form of:</p> <p>gpg --export-secret-key -a "Your name" > mypriv.key</p>	<p>How is the randomness generated?</p> <p>Outline the contents of your key file:</p>
2	<p>Now send your lab partner your public key in the contents of an email, and ask them to import it onto their key ring (if you are doing this on your own, create another set of keys to simulate another user):</p> <p>gpg --import theirpublickey.key</p> <p>Now list your keys with:</p> <p>gpg --list-keys</p>	<p>Which keys are stored on your key ring and what details do they have:</p>
3	<p>Create a text file, and save it. Next encrypt the file with their public key:</p> <p>gpg -e -a -u "Your Name" -r "Your Lab Partner Name" hello.txt</p>	<p>What does the -a option do:</p> <p>What does the -r option do:</p>

		<p>What does the <code>-u</code> option do:</p> <p>Which file does it produce and outline the format of its contents:</p>
4	<p>Send your encrypted file in an email to your lab partner, and get one back from them.</p> <p>Now create a file (such as <code>myfile.asc</code>) and decrypt the email using the public key received from them with:</p> <p><code>gpg -d myfile.asc > myfile.txt</code></p>	Can you decrypt the message:
5	<p>Next using this public key file, send Bill (w.buchanan@napier.ac.uk) a question (http://asecuritysite.com/public.txt):</p> <p>-----BEGIN PGP PUBLIC KEY BLOCK-----</p> <pre> mQENBFxEQeMBCACTgu58j4RuE340W3Xoy4PIX1Lv/8P+FUUFs8Dk4W05zUJN2NfN 45fIASdKCH8cV2wbCVwjKEP0h4p5IE+1rwQK7bWYx7Qt+qmrM5eLMUM8IvXA18wf AOPS7xektZxa4/jwagJupmmYL+Muv9o5haqYp1OYCCVR135kAZfx743YuWcNqvcR 3Em0+gh4F2TXsefjniwuJRGY3kbb/MAM2zC2f7FfCJvb1C300LB+KwCddZP/2311 nOqmzaVF0qQrHQ5EZGK3j3S4fzHNq14TMS3c21YkP00/DV6BkgIHTG5NIIdVEDqh wV8c1pj0ZP7ShIE8cDhty8k+xrIByPUVfPmpABEBAAG0J0JpbGwgQnVjaGFuYW4g PHcuYnVjaGFuYW5AbmFwawVyLmFjLnVrPokBVAQTAQgAPHyHbK9cqX/wECcPQ6+5 TFPDJcQRPXoQBQJCREHjAhsDBQkDwmcABQsJCACCBhUKCQGLagQWAgMBAh4BAheA AAoJEFDPDJcQRPXoQ2KIH/2sRASqbrqCMNMRsiBo9xtCFzQ052odbzubIScnwzrDF Y9z+qPSAawawGO+1R3LPDH5sMLQ2YosNqg8VvTJBt0jR9YGNX9/bqqVFRKKSQ0HiD Sb2M7phBdk4WLkqLZ/AfgHaLKpfNX0bq7WhqZ+Pez0nqjN08JkIog7LhaQzh/Chf Op1+whV0rEFuaDQn83yF5DWB1Dt4fbzfVurEJb92tSrReHALQQA3h5wKTA0qxhdd 9XyEWknDrYCWiw0j0XwjivUre2fw3SKn8KHvJDeDYVKzYy18oA+da+xgs9b+n+Tq mM1fs1whw9wRyp0jbVLEs3yxLgE4e1bCCmgiTNpnmmW5AQ0EXERB4wEIAKCPJqmM o8m6Xm163XtAZnx3t0EJSAV6u0yINIC8aEudNwg+/ptKKanUDm38dPn01lmgOyC FEu4qFJHbMidkEEAc5J01gvhRK7jv94KF3vxqKr/bYnx1tghqCfXesga9jFAHV8J M6sx4exOoc+/52YskpvdUs/eTPnwoQnbgjP+wsZpNq0owS6y05urdF61vefgK5A TFB9lQUE01pb6IMkCBZZvpZW0chbWPwCB9JZMuirdSyksuTldqgEsw7MyKBjCae E/THuTazumad/PyEb0RCbODdMb55L6CD2W2DUquvBLI9FN6KTYwk5L/JZNAIWBV9 TKfevup933j1m+sAEQEAAyKBPAQYAQgAJhYhBK9cqX/wECcPQ6+5TFPDJcQRPXoQ BQJCREHjAhsMBQkDwmcAAoJEFDPDJcQRPXoQGRgh/3592g1F4+WRaPbuCgFEMihd ma5gp1U2J7NjNbV9Icy8VZSGw7UAT7FfmTPq1vwFM3w3gQCDXCKGZtieUkZMTPqb LujBR4y55d5XDY6mP40zwRgdR1en2XsgHLPajRQpAhZq8ZvOdGe/ANCyXvDFHbGy aFAMUFAhxbkBITQKXH+EIkCHXDTDUHUXmAQvsZ8Z+Jm+ZwdhwkMsk43tw8UXLIynp AeOoATdohke3EVK5+0Dc/jezcUwz2IKfw7LB3sQ4c6H8Ey8Pth1NAIgwMCDp5WTB DmForWTU6CpKtwIg/1b1ncbs1H2xAfEUX6ASHXR8vB0nIXWss21FuAanmwe41mw= =S+hs -----END PGP PUBLIC KEY BLOCK----- </pre>	Did you receive a reply:
6	<p>Next send your public key to Bill (w.buchanan@napier.ac.uk), and ask for an encrypted message from him.</p>	

G TrueCrypt

No	Description	Result
1	<p>Go to your Kali instance (User: root, Password: toor). Now Create a new volume and use an encrypted file container (use tc_ yourname) with a Standard TrueCrypt volume.</p> <p>When you get to the Encryption Options, run the benchmark tests and outline the results:</p> 	<p>CPU (Mean)</p> <p>AES: AES-Twofish: AES-Two-Seperent Serpent -AES Serpent: Serpent-Twofish-AES Twofish: Twofish-Serpent:</p> <p>Which is the fastest:</p> <p>Which is the slowest:</p>
2	Select AES and RIPEMD-160 and create a 100MB file. Finally select your password and use FAT for the file system.	What does the random pool generation do, and what does it use to generate the random key?
3	Now mount the file as a drive.	Can you view the drive on the file viewer and from the console? [Yes][No]
4	Create some files your TrueCrypt drive and save them.	<p>Without giving them the password, can they read the file?</p> <p>With the password, can they read the files?</p>

The following files have the passwords of “Ankle123”, “foxtrot”, “napier123”, “password” or “napier”. Determine the properties of the files defined in the table:

File	Size	Encryption type	Key size	Files/folders on disk	Hidden partition (y/n)	Hash method
http://asecuritysite.com/tctest01.zip						
http://asecuritysite.com/tctest02.zip						
http://asecuritysite.com/tctest03.zip						

Now with **truecrack** see if you can determine the password on the volumes. Which TrueCrypt volumes can truecrack?

H Reflective statements

1. In ECC, we use a 256-bit private key. This is used to generate the key for signing Bitcoin transactions. Do you think that a 256-bit key is largest enough? If we use a cracker what performs 1 Tera keys per second, will someone be able to determine our private key?

I What I should have learnt from this lab?

The key things learnt:

- The basics of the RSA method.
- The process of generating RSA and Elliptic Curve key pairs.
- To illustrate how the private key is used to sign data, and then using the public key to verify the signature.
